## Procedure:

In this week we complete:

1.Create new architecture of the project.

2.Connect database.

3.In this week we will add database.

How to add database?!

1. Create a folder for your code.

2. Set up a database.

3. Import the database driver.

4. Get a database handle and connect.

5. Query for multiple rows.

6. Query for a single row.

7. Add data.

## Resuts:

The database/sql package you'll be using includes types and functions for connecting to databases, executing transactions, canceling an operation in progress, and more. For more details on using the package, see Accessing databases. So, in this week we connect database with our project.
